

## How to create a CSR in Plesk 11 Control Panel

- 2021-07-10 - [SSL Πιστοποιητικά](#)

In order to create a CSR in Plesk 11 Control Panel, take the following steps:

1) Log into Plesk Panel

2. Select the tab **Websites & Domains**. Find the option **Secure Your Sites** for the domain you want to install the SSL for

3. On the next page, select **Add SSL Certificate**

4. Next, you must configure your certificate's settings in Latin characters, because if the information is entered in Greek, the issuing authority might cancel the activation request.

No 1 Certificate name: Will help you recognize that specific certificate.

No 2 Country: Fill in your country.

No 3 State or Province: Fill in your state or province, the city or area of your seat. The information that you enter must not exceed 64 characters.

No 4 Location: Fill in your location. The information that you enter must not exceed 64 characters.

No 5 Organization name (company): Fill in the name of the company for which the SSL is issued.

No 6 Domain name: Fill in the domain name, that you wish to activate the SSL certificate for. E.g. your-domain.com.

NOTE: Bear in mind that `www.your-domain.com` is a different name statement from `your-domain.com` when activating security certificates. Please, make sure that you correctly enter the domain (with or without `www`), as you won't be able to change it once you have activated it.

No 7 E-mail: Register your e-mail.

No 8 Confirm that all the information that you have entered is accurate, since they will be used to create the private key. Click on **Request**, in order to create your private key along with the certificate issue request.

5. The certificate has now been added. In order to see the CSR, click on the certificate name

6. On the next page, find the section of the CSR and copy-paste the text starting with the line: `\-----BEGIN CERTIFICATE REQUEST\-----και τελειώνει σε: \-----END CERTIFICATE REQUEST\---`

NOTE: Make sure that you use lower-case Latin characters instead of upper-case.
