

Create DNS records with just one click

- 2021-11-17 - Papaki Panel

We gathered all the necessary records for the most popular platforms such as blogger, Google Apps, Website Builder, Weebly, Webnode, WordPress, WIX etc, so all you have to do is click on the platform of your choice and then "SAVE" to create the records for your domain! The only thing that is left to do is log in to your blog or site and insert your domain name, there too.

The screenshot shows a web interface for managing DNS records. At the top, it displays "DOMAIN WEBSITE PREVIEW" and "Nameservers: (Edit)". Below this, a modal window titled "DNS Hosting Service" is open, showing the domain name "mydomain.gr". The interface is divided into "POPULAR SERVICES" and "ADVANCED" tabs. Under "POPULAR SERVICES", there is a section for "One click DNS activation" which lists various platforms: website builder, papakishop.gr (with a green checkmark), Blogger, Gmail (with a green checkmark), TypePad, weebly, yola, webnode, Ning, tumblr, Jimdo, and FLAVORS. Below the list, it states "The existing DNS settings are the following:". At the bottom of the page, there is a section for "REGISTRANT CONTACT DETAILS:".
